

Does your patient need assessment for post traumatic amnesia?

Post traumatic amnesia (PTA) is when a person is disorientated or unable to retain new information following a mild head injury. This module explains how to assess patients in the acute care setting for PTA using the A-WPTAS screening tool.

This module will guide you on how to:

- Identify early symptoms of post traumatic amnesia.
- Use the A-WPTAS screening tool to assess a patient for post traumatic amnesia following a mild head injury.
- Apply the A-WPTAS assessment and clinical judgment to guide ongoing care for a patient following a mild head injury.

Improve your assessment for PTA using the A-WPTAS.
